ABSTRACT

A product selling system is provided which allows clients with networks accessible to the Internet to contact a service provider network for purchases. The service provider network includes a database with three dimensional (3D) image data for a variety of its products, and an application which allows a 3D product image to be integrated into a corresponding 3D image of a projected receiving space for the product prior to purchase. A web server which has a program operative with the database facilitates image manipulation to produce a 3D sample image from a product image on the web page if a client desires.
